

A Junior Olympiad Geometry Problem

by Chris Patterson

Problem

Let ABCD be a convex quadrilateral such that $\angle BAD = 45^\circ$, $\angle ADC = \angle ACD = 75^\circ$ and $AB = CD = 2$. Find the length of BC.

Sketch

<https://www.geogebra.org/m/qszdbxhx>

If you make an accurate sketch and measure BC, it appears to be 2 units. If the answer must be a positive integer, then 2 is almost certainly correct.

Proof 1

Sine addition formula: $\sin(a + b) = \sin(a)\cos(b) + \cos(a)\sin(b)$

$$\sin(75^\circ) = \sin(45^\circ + 30^\circ)$$

$$= \sin(45^\circ)\cos(30^\circ) + \cos(45^\circ)\sin(30^\circ)$$

$$= \frac{1}{\sqrt{2}} \left(\frac{\sqrt{3}}{2}\right) + \frac{1}{\sqrt{2}} \left(\frac{1}{2}\right)$$

$$= \frac{\sqrt{6} + \sqrt{2}}{4}$$

$$\text{Similarly, } \sin(15^\circ) = \sin(45^\circ + (-30^\circ))$$

$$= \sin(45^\circ)\cos(-30^\circ) + \cos(45^\circ)\sin(-30^\circ)$$

$$= \frac{1}{\sqrt{2}} \left(\frac{\sqrt{3}}{2}\right) + \frac{1}{\sqrt{2}} \left(\frac{-1}{2}\right)$$

$$= \frac{\sqrt{6} - \sqrt{2}}{4}$$

Next, use the sine law in triangle ACD to get solve for AC:

$$\frac{AC}{\sin(75^\circ)} = \frac{2}{\sin(30^\circ)}$$

$$AC = \frac{2\sin(75^\circ)}{\sin(30^\circ)}$$

$$= \frac{2\left(\frac{\sqrt{6} + \sqrt{2}}{4}\right)}{\frac{1}{2}}$$

$$= \sqrt{6} + \sqrt{2}$$

Finally, use the cosine law in triangle ABC to solve for BC:

$$\overline{BC}^2 = 2^2 + (\sqrt{6} + \sqrt{2})^2 - 2(2)(\sqrt{6} + \sqrt{2})\cos(15^\circ)$$

$$\text{We know } \cos(15^\circ) = \sin(75^\circ) = \frac{\sqrt{6} + \sqrt{2}}{4}$$

$$\text{Therefore, } \overline{BC}^2 = 4$$

Hence, $\overline{BC} = 2$, as expected.

Proof 2

Find $AC = \sqrt{6} + \sqrt{2}$ as in Proof 1.

Convert the polar coordinates $C = (r, \theta)$ to cartesian coordinates (x, y)

$\cos(15^\circ) = \frac{x}{\sqrt{6} + \sqrt{2}}$ $x = (\sqrt{6} + \sqrt{2})\cos(15^\circ)$ $= (\sqrt{6} + \sqrt{2})\frac{\sqrt{6} + \sqrt{2}}{4}$ $= 2 + \sqrt{3}$	$\sin(15^\circ) = \frac{y}{\sqrt{6} + \sqrt{2}}$ $y = (\sqrt{6} + \sqrt{2})\sin(15^\circ)$ $= (\sqrt{6} + \sqrt{2})\frac{\sqrt{6} - \sqrt{2}}{4}$ $= 1$
--	---

C has the coordinates $(2 + \sqrt{3}, 1)$

Next, drop a perpendicular from C to the x-axis. Call the new point E.

In triangle BEC, BC is the hypotenuse

$$\begin{aligned} \overline{BC}^2 &= \overline{BE}^2 + \overline{EC}^2 \\ &= \sqrt{3}^2 + 1^2 \end{aligned}$$

Hence, $\overline{BC} = 2$

Reflection

Is there a solution that starts by proving $\angle ACD = 15^\circ$?

Then triangle ABC is isosceles and $BC = 2$ is trivial.
